

## How I connected my MongoDB to the Power BI

Azamat Jubandyqov 26416

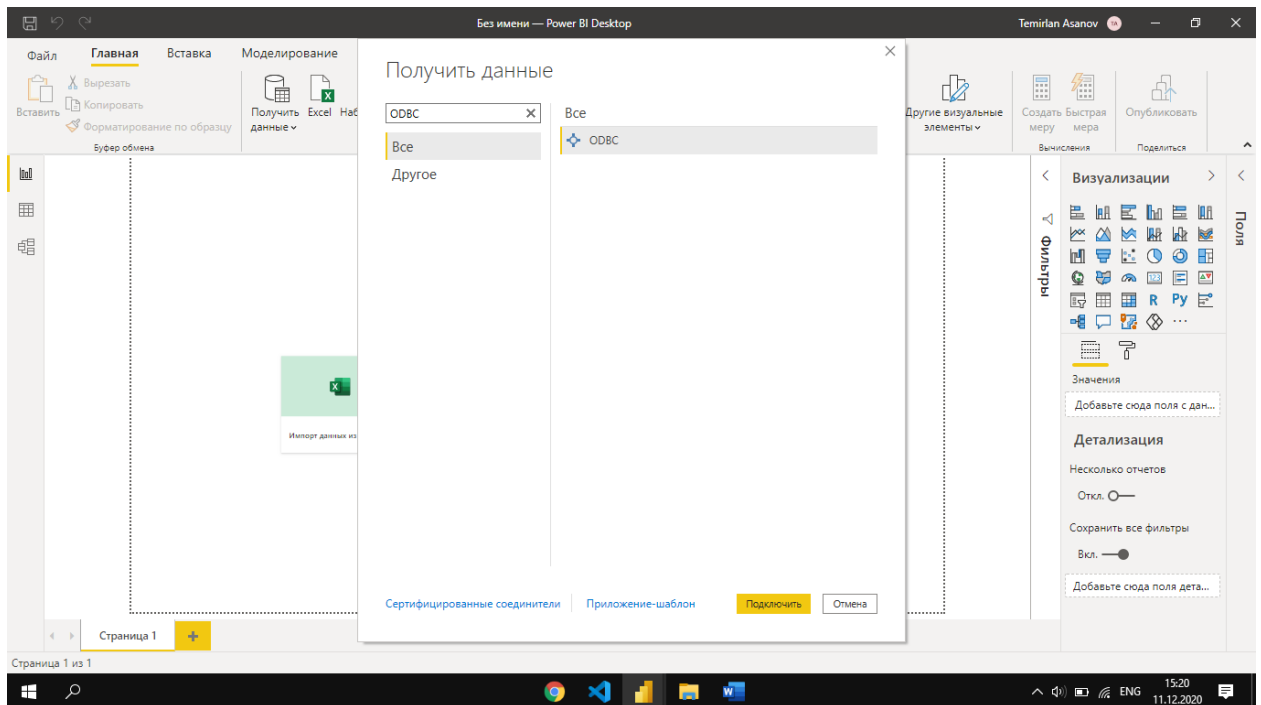

- Connecting to the drivers

I used ODBC driver as a BI connector for my MongoDB database.

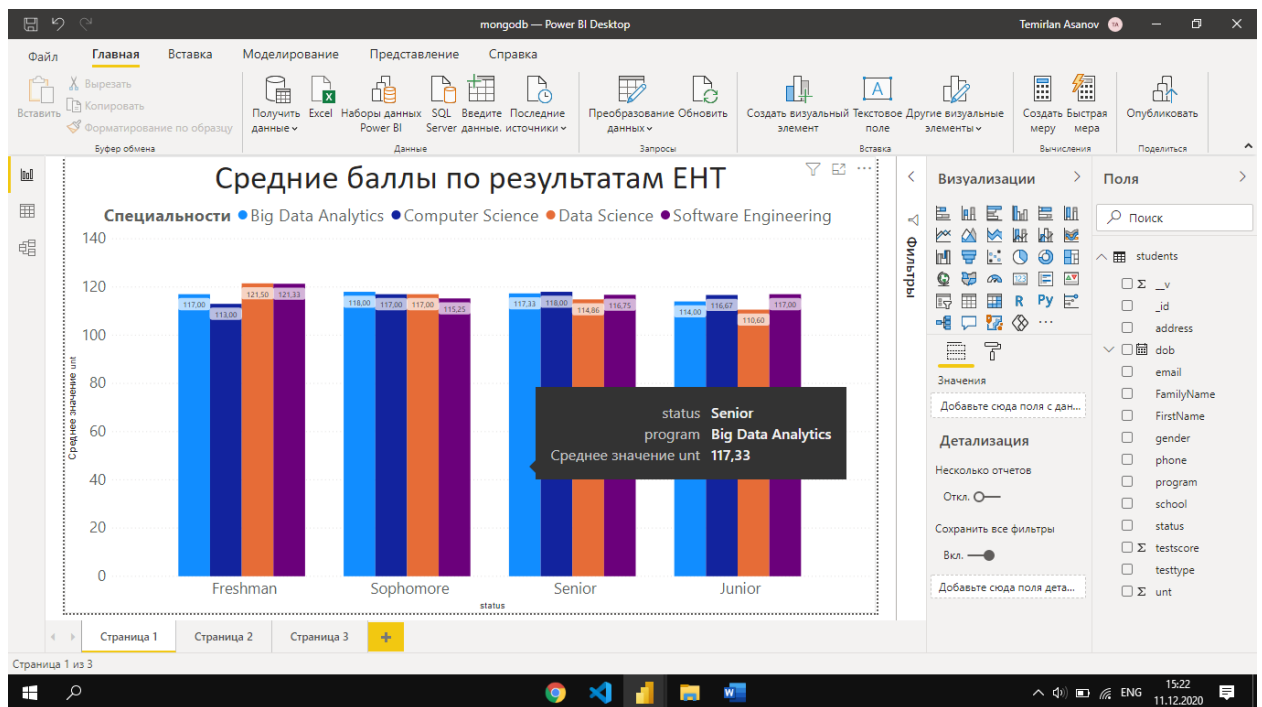

I added on System DNS a Connection ODBS.

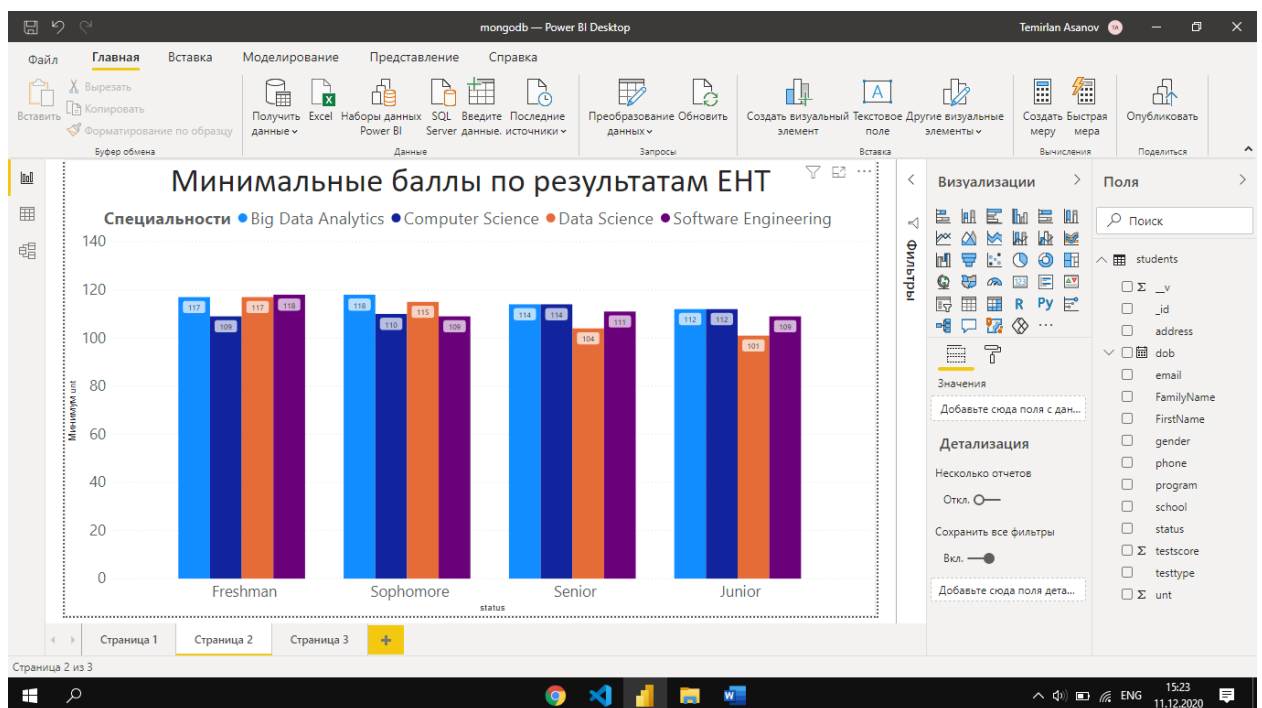

On PowerBI Desktop on section GET DATA, I choosed ODBS.

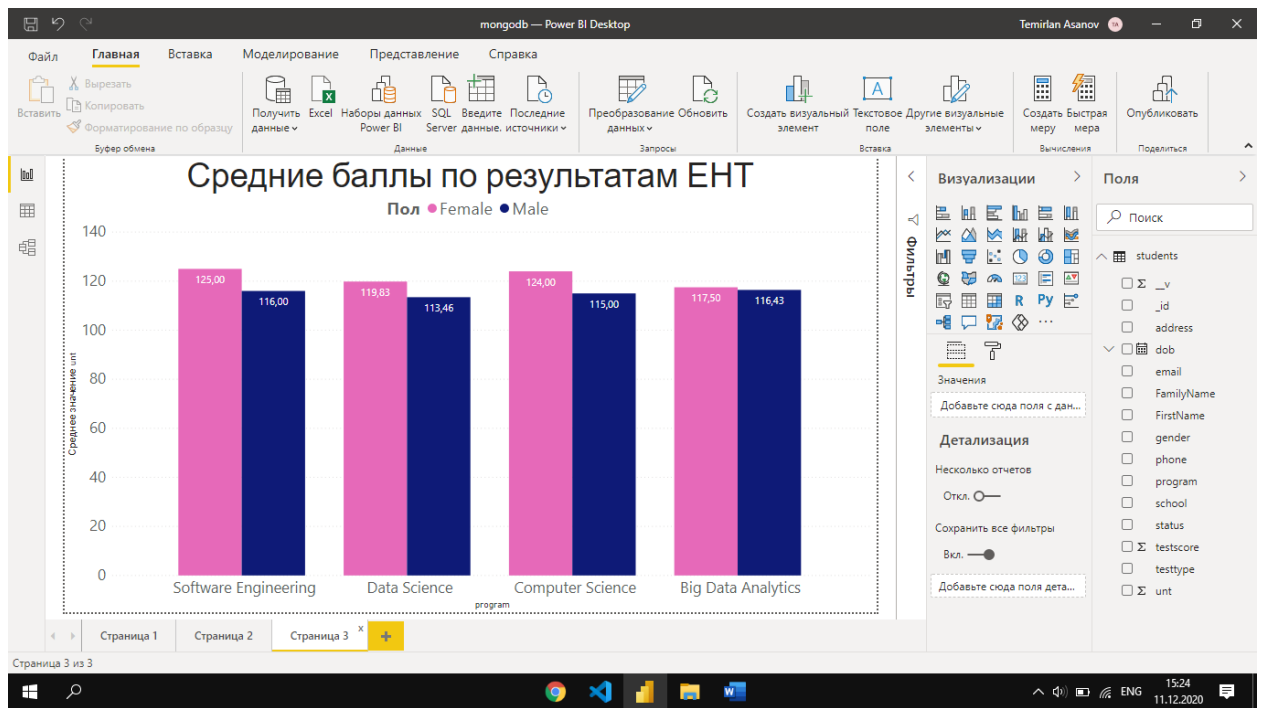

My all data from MongoDB databased that I collected thought Web Appliaction translated to the Power BI, where I can created different sort of diagrams and charts.

On my first page I calculated the average UNT point scores for different programs and on my X axis located the year of education of a particular student.

On my second page, I collected the minimum scores for UNT for different specializations.

On my last page, you can see the difference between two genders in different university program. On average, Females score more that Males.
